Positively Identify Virtual Patients

With the proliferation of telemedicine practices, there is a growing need for a reliable way to positively identify virtual patients. You can speak to a patient via Skype, but how do you handle the verification that was being done via barcoding technology in the physical hospital facilities? Our app can be plugged onto any current workflow, could be an auto email or inserted in an appointment being set up online etc. with in a matter of days.

Features / Benefits

- ID Validation - Approved documents such as a license or passport are verified as authentic
- Facial Recognition - Customers' face is matched with ID by using a mobile phone camera or computer
- Advanced Algorithm - Information extracted from approved documents uses real-time global data, machine learning, and network insights across the five core data attributes (email, phone, person, address, and IP) to verify good customers.
